

## Daikin Quaternity Guarantees Superior Air Quality

Global warming has severely affected the seasons which can adversely affect our health because it impacts our immunity against diseases, especially respiratory related illnesses.

For example, in North America, a milder winter is being experienced in general. In fact, most Canadians in Ontario celebrated a green Christmas during the recent holidays. The summers, meanwhile, have become cooler. Thankfully, the newly developed [Quaternity air conditioning system from Daikin](#) has been introduced to improve the quality of indoor air for better health – no matter what weather conditions prevail.

Daikin is a trusted name in the HVAC industry and they continually re-invent their products to remain viable in present situations. And now, they have the Daikin Quaternity, an air conditioning marvel that works in four ways to improve the general air quality inside a room. It is an air cooling system, an air filtration system that cleans the air, a dehumidification system and is also a heating system. This product is environmentally sustainable and saves you money on energy consumption.

[Quaternity](#) features the new technology called the “flash streamer” that decomposes pathogens and other harmful elements and then removes their traces from the air. Some of the common harmful airborne components in the household that it can handle are molds, allergens, chemical gases, and even bacteria like E. coli. Eliminating these common household air pollutants can prevent the occurrence of many diseases. Quaternity gives you the freshest and the best quality of air, especially if you live in the city. The system ensures that your home is a “real sanctuary” by maintaining air quality that is safe for you and your family.

Aside from giving healthy air in the home or even in the office, Quaternity can also act as an effective dehumidifier during humid days and as a heat pump during the winter. It means that all throughout the year, this advanced air conditioning system will maintain air quality indoors. This is especially handy because of the weather changes being experienced– milder winters and cooler summers.

And with all the things that the Quaternity can do, it is remarkably cost-efficient because it uses the least amount of energy, as compared with other air conditioning units. This is a great innovation from Daikin that residents of Canada should check out from [Daikin’s Ontario distributor](#). If your old unit needs a replacement or you have acquired a new place, then Daikin Quaternity is a highly recommended air conditioning system with superior air quality.
